

In this Project we have tasked ourselves to create and talk about the concept of how companies use technology to improve their business and performance. Speaking of a specific method of having fast, reliable and efficient way to deliver value and products to customers; The drone delivery system!

We will be talking and showing how the customer will have access to buy and see inventory of the company's product through a website that will help the customer select from which store they can search from, to have access to how and where their product can be delivered etc.. that will be brought to you by Samuel Bastardo.

Next will be the drone delivery system, the algorithm used to create the machine, the specific requirements needed for the delivery and how it operates will be explained by Samuel Fujihara.

After finding out how the drone works, then we will work on how the drone will access weather monitoring and safety measures, the how and why will be mentioned by Mariia Kurko.

And Finally Edwin Vega will present how the drones will be effective in the field and talk about the financial impact from the drone delivery system.
